

BULLET BUMPER™

About Us

Bullet bumper was designed to meet all of the needs required when pulling hdd bundles into a single borehole. The pipeline industry has now gone to pulling multiple pipes in to one single borehole instead of separate drills being needed to place multiple pipelines. When pulling multiple pipelines in the same borehole spacers are required to keep each pipe from touching the pipe next to it. Bullet bumper is a user-friendly pipe spacer that's twice as fast to install and has a unique shape to which allows the bullet bumper to easily transition over pipe rollers and cradle slings safely with little to no resistance.

Why choose Us?

- ✔ Bullet bumpers have been field tested and currently being used on projects this year.
- ✔ By using bullet bumper you will be able to cut down on the number of pieces of equipment needed on pullback operations therefore saving thousands of dollars on each bundle drill.

Give bullet bumper a call on your next bundle project or to set up a demonstration.
